

**For Immediate Release**

**Safe Spacer™ wearable social distancing monitor shipping soon,  
pre-orders opened**

*Groundbreaking digital safety device adds docking station and compliance monitoring options*

*August 13, 2020* - **Safe Spacer™** is a lightweight wearable device that helps workers and visitors maintain safe social distancing, enabling factories, offices, museums, hotels and other workplaces and public spaces to operate with peace of mind. It now provides even more flexibility, giving small businesses a simple-yet-effective solution with more convenient ways to wear, charge and sync, as well as offering comprehensive integration options for large-scale enterprises using their own proprietary data systems. These tools make Safe Spacer the most convenient, flexible system for virtually any organization.

Safe Spacer precisely detects when other Safe Spacer units come within 2m/6ft\*, alerting wearers with a choice of visual, vibrating or audio alarm. Using Ultra-wideband technology, Safe Spacer offers accuracy up to 10x better than Bluetooth, and also gives users the option to store "collision" data to monitor compliance or perform fast contact tracing.

Users can choose from a range of lanyard, wristband, and belt loop options to adapt to any workplace without compromising existing safety protocols.

\* *distances are customizable*

To help organizations manage multiple devices, optional **S-Charger** docking/charging stations allow up to 25 Safe Spacers to charge simultaneously. The S-Charger can also be connected to a computer running Safe Spacer's free software to customize settings in bulk and can be easily daisy-chained to save space and wiring.

Each Safe Spacer device also features a unique ID tag and built-in memory for tracing any unintended contacts. To maintain high privacy standards, no data except the device's ID and proximity is stored on the device; associating IDs with wearer names is completely optional and done externally in software.

This data can be retrieved by the S-Charger while charging, or wirelessly via the optional **S-Bridge** UWB access unit. These can be positioned in strategic locations to read the data from Safe Spacer devices as users approach, eliminating the need for long employee queues to download their device data.

Both the S-Bridge and S-Charger can connect to any computer via USB, and the free Safe Spacer software will extract this data for review. Furthermore, Safe Spacer offers additional options to synchronize data from multiple access points, easily enabling companies to compile data from an entire facility in the cloud, or integrate this data into existing enterprise systems.
